

Malaria Deaths in Africa: 2000 - 2014

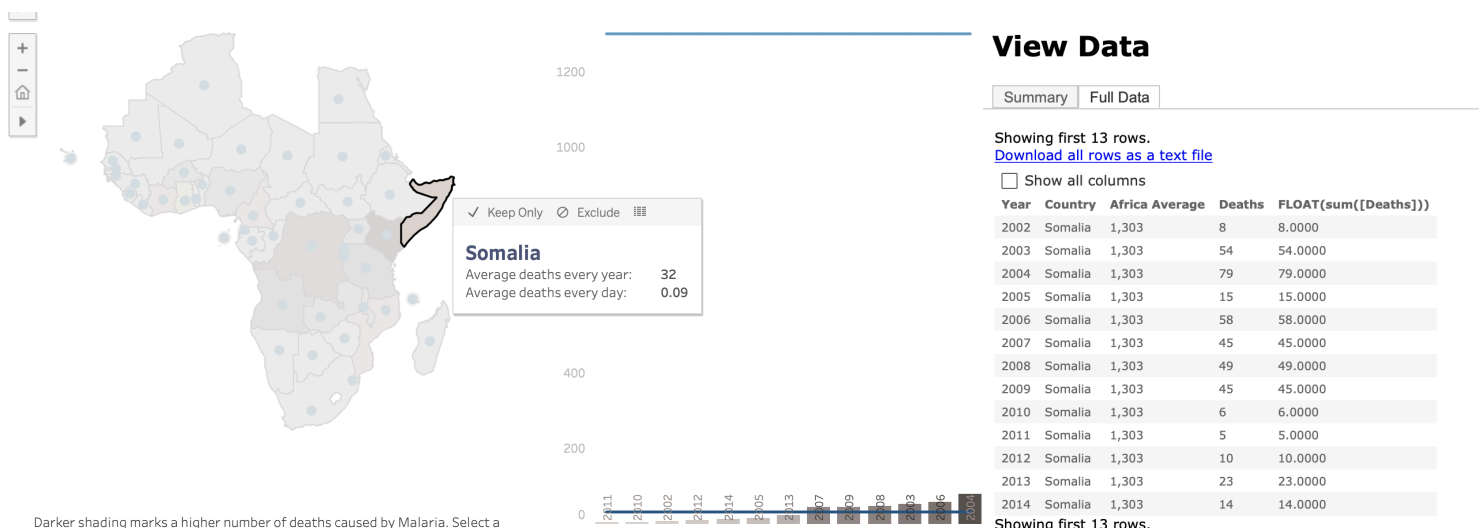

According to the map that we have, it is clear that the most affected countries located in the center and eastern of Africa.

Kenya was the most affected country by Malaria since it has the darkest shade on the map. By clicking on Kenya we can see that its highest recorded death rate was in 2003, where the total number of deaths was more than 50,000. The death rate had decremented significantly starting from 2011 where it was less than 1000.

From the dashboard we have, and by clicking on different countries on the map, we noticed that Kenya was not the only country that had recorded a high rate of total deaths in 2003. There were also other African countries where they recorded a high death rate in that year, such as Angola. During 2000 - 2014 its average number of deaths every year, which is represented by the horizontal blue line, was 11,469 while in 2003 it was much higher than the average, where it was slightly less than 40,000 deaths.

The map shows that there were countries where they were less affected by Malaria. By clicking on Somalia which has a light shade on the map, we can see that its death average was 32 deaths per year while the Africa average is 1,303 deaths per year. I also clicked on the table icon next to Exclude option to view the data table, which shows that Somalia highest deaths were 79 deaths in the year 2004.
